

system infections

13a-1

other clinical groupings

13a-2

anatomy	clinical picture	microorganisms (areas affected)				
sinuses etc.	rhinitis (sinusitis etc.)	rhinovirus	parainfluenza viruses	<i>Haemophilus influenzae</i> *	influenza virus	pertussis
palate	pharyngitis					respiratory syncytial virus
tongue						
defensive ring of lymphoid tissue						
tonsil						
esophagus						
larynx	laryngitis					
tracheobronchial lymph nodes	tracheitis					
alveolar macrophage	bronchitis					
bronchiole	bronchiolitis					
alveolus	pneumonia

VIRUSES CAUSING COMMON COLDS

virus	types involved	attachment mechanism	disease
rhinoviruses (>100 types)*	several at any given time in the community	capsid protein binds to ICAM-1 type molecule on cell**	common cold
coxsackie virus A (24 types)	especially A21	capsid protein binds to ICAM-1 type molecule on cell**	common cold; also oropharyngeal vesicles (herpanginal and hand, foot and mouth disease (A16))
influenza viruses	several	hemagglutinin binds to sialic acid-containing glycoprotein on cell	may also invade lower respiratory tract
parainfluenza virus (4 types)	1,2,3,4	viral envelope protein binds to glycoside on cell	may also invade larynx
respiratory syncytial virus	11 type	—	may also invade lower respiratory tract
coronaviruses (several types)	all	viral envelope protein binds to glycoprotein receptors on cell	common cold
adenovirus (41 types)	5–10 types	penton fiber binds to cell receptor	mainly pharyngitis; also conjunctivitis, bronchitis
echoviruses (34 types)	11, 20	—	common cold

* a given type shows little or no neutralization by antibody against other types.

** ICAM-1: intercellular adhesion molecule expressed on a wide variety of normal cells; member of immunoglobulin superfamily, coded on chromosome 19

13e

VIRAL PNEUMONIA

virus	clinical condition	comments
influenza A or B	primary viral pneumonia or pneumonia associated with secondary bacterial infection	pandemics (type A) and epidemics (type A or B); increased susceptibility in elderly or in certain chronic diseases
parainfluenza (types 1-4)	croup, pneumonia in children less than five years of age; upper respiratory illness (often subclinical) in older children and adults	antivirals and vaccines not available
measles	secondary bacterial pneumonia common; primary viral (giant cell) pneumonia in those with immunodeficiency	adult infection rare but severe; King and Queen of Hawaii both died of measles when they visited London in 1824
respiratory syncytial virus	pneumonitis pneumonia (infants); common cold syndrome (adults)	peak mortality in 3-4-month-old infants; secondary bacterial infection rare
adenovirus	pharyngoconjunctival fever, pharyngitis, atypical pneumonia (military recruits)	no antivirals; vaccines not generally available
cytomegalovirus	interstitial pneumonia	in immunodeficient patients (e.g. AIDS)
varicella-zoster virus	pneumonia in young adults suffering primary infection	uncommon; recognized 1-6 days after rash; lung lesions may eventually calcify

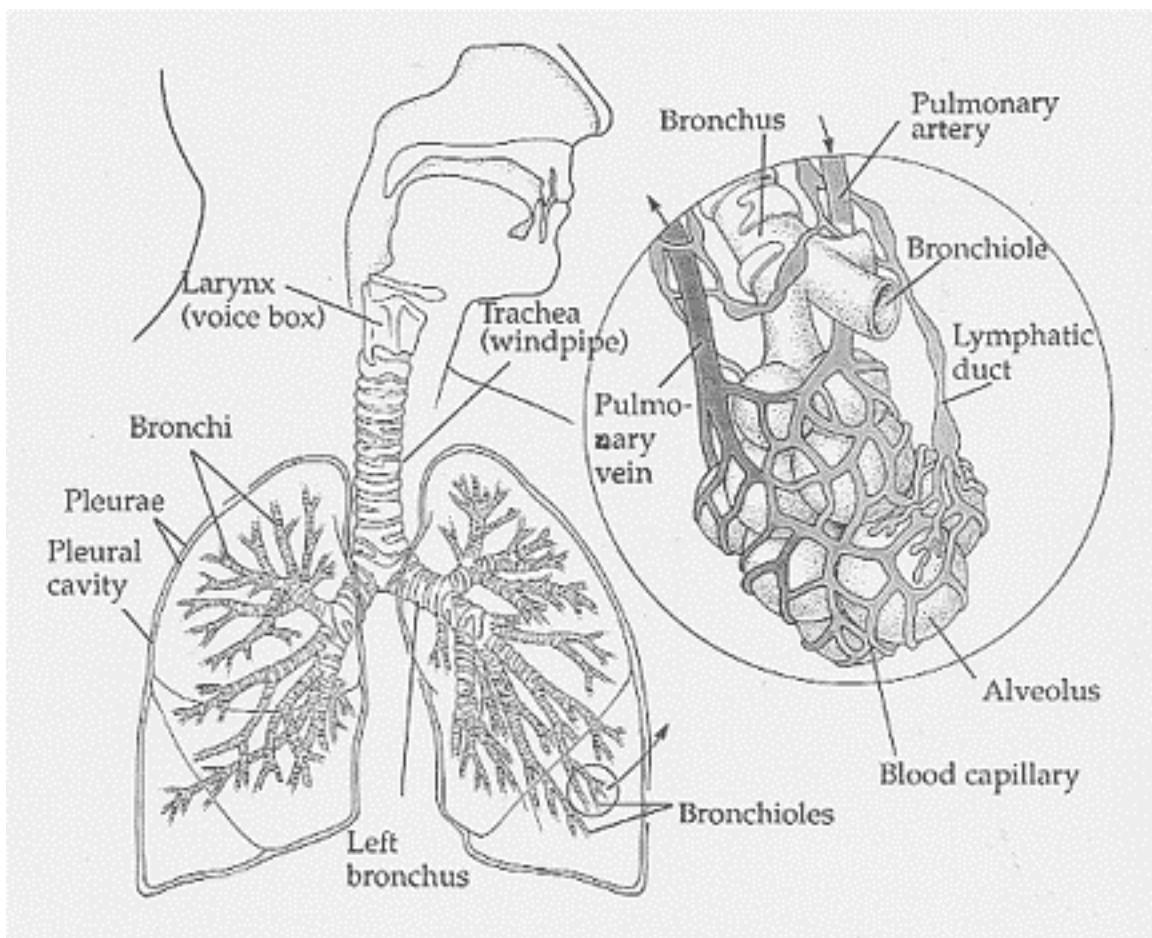

RESPIRATORY INVADERS – PROFESSIONAL OR SECONDARY		
type	requirement	examples
professional invaders (infect healthy respiratory tract)	adhesion to normal mucosa (in spite of mucociliary system)	respiratory viruses (influenza, rhinoviruses) <i>Streptococcus pyogenes</i> (throat) <i>Strep. pneumoniae</i> <i>Mycoplasma pneumoniae</i> chlamydia (psittacosis, chlamydial conjunctivitis and pneumonia, trachoma)
	ability to interfere with cilia	<i>Bordetella pertussis</i> , <i>M. pneumoniae</i> <i>Strep. pneumoniae</i> (pneumolysin)
	ability to resist destruction in alveolar macrophage	<i>Legionella</i> , <i>Mycobacterium tuberculosis</i>
	ability to damage local (mucosal, submucosal) tissues	<i>Corynebacterium diphtheriae</i> (toxin) <i>Strep. pneumoniae</i> (pneumolysin)
secondary invaders (infect when host defenses impaired)	initial infection and damage by respiratory virus (e.g. influenza virus)	<i>Staphylococcus aureus</i> ; <i>Strep. pneumoniae</i> pneumonia complicating influenza
	local defenses impaired (e.g. cystic fibrosis)	<i>Staph. aureus</i> , <i>Pseudomonas</i>
	chronic bronchitis	<i>Hemophilus influenzae</i> , <i>Strep. pneumoniae</i>
	local foreign body or tumor	
	depressed immune responses (e.g. AIDS, neoplastic disease)	<i>Pneumocystis carinii</i> , cytomegalovirus, <i>M. tuberculosis</i>
	depressed resistance (e.g. elderly, alcoholism, renal or hepatic disease)	<i>Strep. pneumoniae</i> , <i>Staph. aureus</i> , <i>H. influenzae</i>

Fig. 16.4 The two types of respiratory invader.

VIRUSES CAUSING COMMON COLDS			
virus	types involved	attachment mechanism	disease
rhinoviruses (>100 types)*	several at any given time in the community	capsid protein binds to ICAM-1 type molecule on cell**	common cold
cold-sackie virus A (24 types)	especially A21	capsid protein binds to ICAM-1 type molecule on cell**	common cold; also oropharyngeal vesicles (herpangina) and hand, foot and mouth disease (A16)
influenza viruses	several	hemagglutinin binds to sialic acid-containing glycoprotein on cell	may also invade lower respiratory tract
parainfluenza virus (4 types)	1,2,3,4	viral envelope protein binds to glycoside on cell	may also invade larynx
respiratory syncytial virus	(1 type)	—	may also invade lower respiratory tract
coronaviruses (several types)	all	viral envelope protein binds to glycoprotein receptors on cell	common cold
adenovirus (41 types)	5–10 types	penton fiber binds to cell receptor	mainly pharyngitis; also conjunctivitis, bronchitis
echoviruses (34 types)	11, 20	—	common cold

* a given type shows little or no neutralization by antibody against other types
** ICAM-1: intercellular adhesion molecule expressed on a wide variety of normal cells; member of immunoglobulin superfamily, coded on chromosome 19
